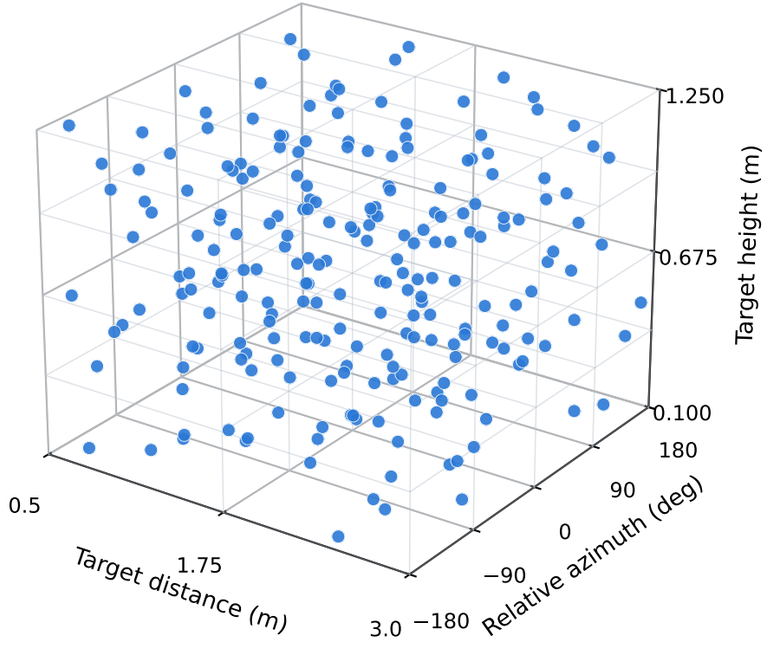
How do the splits cover distance, direction and height?

Grid: 2 distance bins x 4 azimuth bins x 4 height bins = 32 strata.

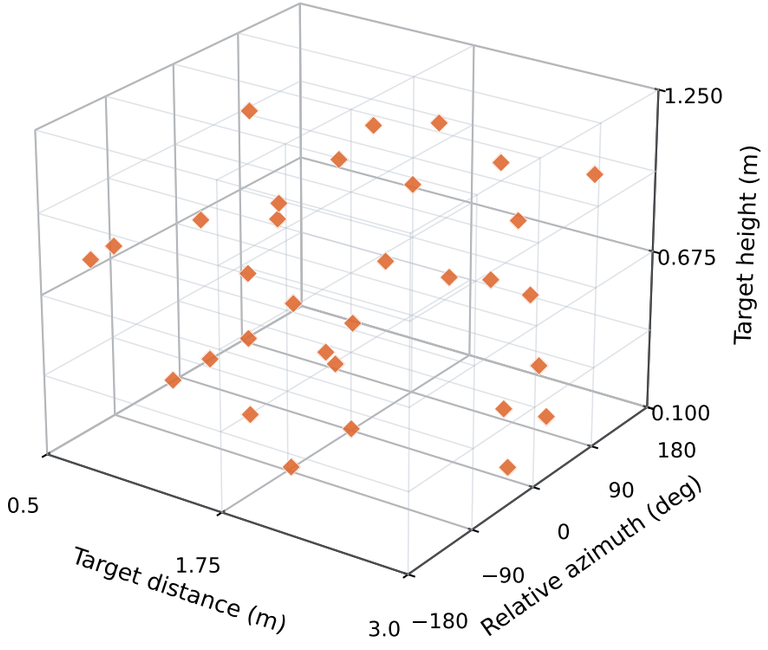
Fitting | n = 221

Used to learn the policy



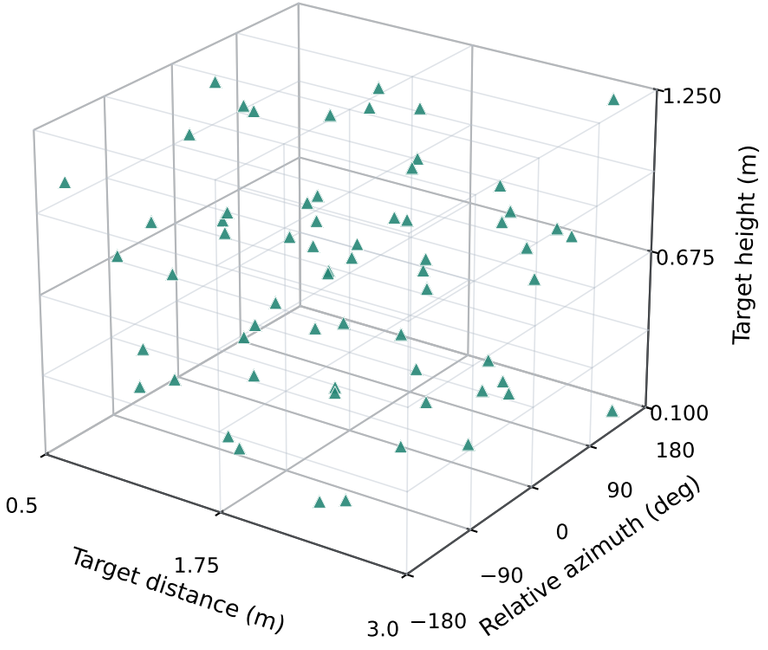
Validation | n = 32

One scene in each of 32 strata



Test | n = 64

Separate Sobol design



Validation has exactly one scene per stratum; fitting and test cover the same parameter ranges.
These three coordinates do not show the full six-dimensional scenario design.
